# KiwiCall+

Call system for managing multiple production lines

KiwiCall+ integrates a tablet or a PC in the KiwiCall system, from which up to 7 production lines can be managed.

KiwiCall+ involves the use of:

- a Mini PC + Transmitter to be installed in the company network
- a Tablet or PC that connects to the application*
- an KeyTouch system + vehicle KiwiCall*

How does it work?

KiwiCall+ controls up to 7 virtual KiwiCall systems via tablet or PC.

Via the device, one of the KiwiCall buttons can be pressed when the production line needs to be unloaded. The request arrives at the KeyTouch installed on the vehicle and the operator can accept it or not.

From the tablet or PC, it is possible to see whether the request was accepted or not when the KiwiCall was pressed.

Designed to *simplify* work flows

KiwiCall+ requires a smaller number of physical devices that are integrated among them and allows a precise and efficient control of the production line.

*The tablet or PC and the KeyTouch + KiwiCall on the vehicle are not included in the kit.
