

# Anticollision

## 360° COLLISION PREVENTION

Preventing accidents between trucks and operators on foot is crucial to ensure safety and reduce costs related to downtime and damage.

With the anti-collision system with tags, you face this challenge effectively: the detection area around the truck helps you protect operations and vehicles during manoeuvres through vibrations, acoustic and visual signals.

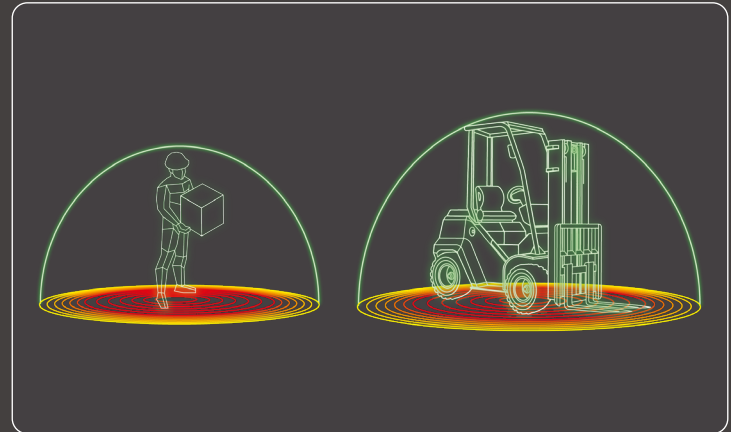

### BENEFITS

- **Prevent collisions** and injuries
- **Eliminate costs** due to claims and interruptions at work.
- Create **a safer environment**.

Solution for:

**PREVENTING ACCIDENTS  
BETWEEN VEHICLES AND  
PEDESTRIANS**

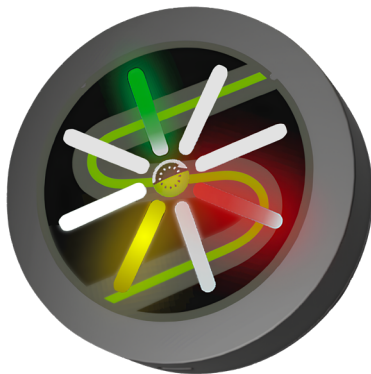

# PEDESTRIAN TAG

Thanks to the pedestrian tag, operators on foot are **alerted whenever a vehicle approaches beyond the set warning threshold**, so **protect your team** with a **simple solution** that helps reduce the risk of accidents.

To display the distance to the detected vehicle or pedestrian, you can **integrate the KiwiSafe device** to the collision avoidance system, or the **KeyTouch device** that also allows you to digitise the fleet with obvious advantages:

- improved operational safety and productivity,
- reduce vehicle maintenance costs,
- monitor the status of the means with data on utilisation.

In addition, thanks to KeyTouch **you intervene in a targeted manner on the areas at greatest risk** through heatmaps, which allow you to identify on the map of your facility the zones most prone to accidents, namely **near-misses (missed accidents)**.
